Rick Roll Detector

Welcome to Rick Roll Detector! First, on behalf of JET Technologies, I would like to thank you for downloading these extensions for your google chrome browsers! Hopefully you will not be rick rolled as much as before from now on!

Now, this is a guide that will help you throughout the journey of using this extension. We highly suggest you download this PDF so that you can use it after you close this window, as the only way to get this document up again is by reinstalling the extension.

Current Features

1. A setting menu which allows you to enable/disable the autodetector and allows you to set website urls to not scan for rick rolls.
2. JETBlocker Technology - Automatically shows a warning when the page you are visiting has the video of the rickroll or has a link to the rickrolling video.
3. Risky RickRoll Site(RRS) Technology - Allows users to report websites they found that contain a rick roll so that other people won't be rick rolled.
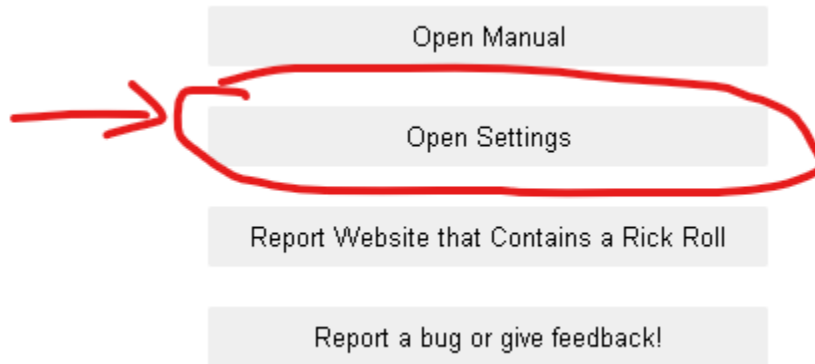

Planned Features

1. Improved JETBlocker systems - This will include better scanning systems to make sure most if not all rick rolls are blocked.
2. Machine Learning Capabilities - Learn how strict the extension should block rick rolls and the strictness throughout the time of a day.. The stricter the filter is, the longer the load time of a website is.
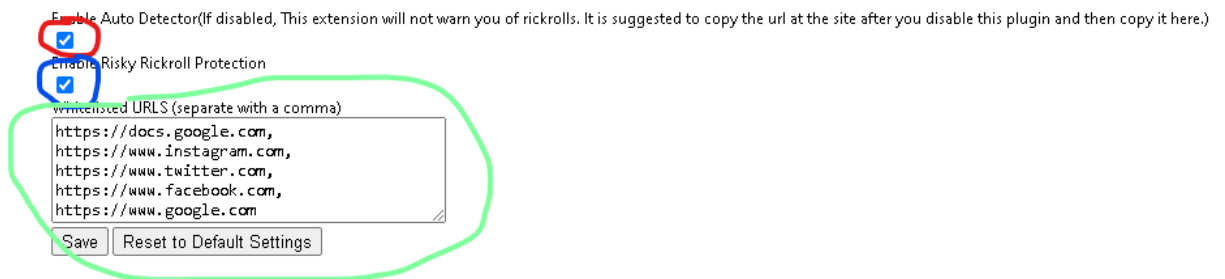

<u>Settings Guide</u>

The settings page will allow you to change how the extension will behave throughout the journey with us. Below is a guide of how to access the settings page and how to change the settings, as well as each option's meanings.

1. Find the extension icon
2. Click on the icon, then click on Open Settings

3. This will open up a new page with the setting page

4. The option circled in red is like "the master switch". If it is checked, then the plugin is on, if it is unchecked, the plugin is not on. This is defaulted to being checked on
5. The option circled in blue is for enabling/disabling the RRS Technology(explained in the RRS Technology Section)
6. The textarea that is circled in green is where you put the urls of websites you do not want the RickRoll detector to warn you.
   a. There are 5 websites currently set as default.
      i. https://docs.google.com
      ii. https://www.instagram.com
      iii. https://www.twitter.com
      iv. https://www.facebook.com
      v. https://www.google.com

b. Each url should just be it's domain(e.g. https://www.example.com) it should not contain any other parts of a url. Some examples of what an incorrect format of a url:
    i. google.com
    ii. www.google.com
    iii. https://google.com/privacy
c. Any malformed URL will not work and the Auto Detector will still scan for that site.
d. Each url is separated by a comma.
e. The protocol(e.g. https://, http://) is required for a url to work.
f. If https://www.youtube.com is on the list, everything that starts with https://www.youtube.com will not be checked, but https://youtube.com(without the www part) will still be checked.

7. The save button saves the settings you input.
8. The Reset to Default Settings resets everything to default.

JETBlocker

In the current version whenever the video id of Never Gonna Give You Up(dQw4w9WgXcQ) shows up in it's html code, the website will be closed and the JETBlocker page will show up. If you click on Continue to the next page, the current website with properly formed url will be saved to the whitelisted urls and then redirect you to the page you were trying to enter originally. The next time you visit the Settings page, the website url will show up in the appropriate field.

RRS Technology

As a community, we usually communicate with other people on where rick roll exists and generally help each other out when a new site that contains rick roll is found. WIth the first version of this technology introduced in the v1.1 update, it brought changes to the settings page and the JETBlocker, and at the same time, a new page was added.

Let's start on the settings page. A new option called *Enable Risky Rickroll Protection* was added. When this option is checked, the RRS Technology connects to a server that stores all of the website users reported, alongside with the basic protection. When this option is unchecked, the RRS Technology will not function, instead, only the basic protection will be enforced.

Now, on the JETBlocker page, there are different texts when a website is blocked because of the RRS Technology.

The coolest thing in the RRS Technology in my opinion is the ability for each individual user to submit a website that contains a rick roll in them. All you have to do is to go to the Main Menu by clicking on the extension icon and then click on *Report*

Website that Contains a Rick Roll, follow the form, and you will be able to submit the website for review. We have a brave team that is willing to be rick rolled to bring users the best experience possible.

Conclusion

Once again, thank you for using RickRollDetector by JETTechnologies! This extension is still early in the development phase but it will receive a lot of love by our lovely developers to bring you the best extensions for google chrome.

Feel free to contact JETTechnologies@outlook.com to request support! (psst… A discord server will be created soon!)
